

## Perpendicular bisector of a segment

	After doing this	Your work should look like this
1	Start with a line segment PQ.	
2	Place the compasses on one end of the line segment.	
3	Set the compasses' width to approximately two thirds the line length. The actual width does not matter.	
4	Without changing the compasses' width, draw an arc above and below the line.	
5	Again without changing the compasses' width, place the compasses' point on the other end of the line. Draw an arc above and below the line so that the arcs cross the first two.	

6	Using a straightedge, draw a line between the points where the arcs intersect.	
7	Done. This line is perpendicular to the first line and bisects it (cuts it at the exact midpoint of the line).
